

# Yu Xiu

(434) 422-2707 | [xiuyutiffany@gmail.com](mailto:xiuyutiffany@gmail.com) | [LinkedIn](#) | [Github](#) | [Portfolio](#)

## Education

---

### San José State University

San José, CA

*M.S. in Computer Science | GPA: 3.6*

*Dec 2024*

*B.S. in Computer Science | GPA: 3.7*

*Dec 2020*

### Stanford University Summer Session

Stanford, CA

*Visiting Graduate Student, Computer Science*

*Jun – Aug 2024*

## Experience & Projects

---

### Applied AI Engineer & Founder

Bay Area, CA

*Darluwin AI Labs (Early-stage Startup)*

*Aug 2025 – Present*

#### DaResume | Demo

- Built and launched a resume-to-job matching product using **React, TypeScript, FastAPI, and Supabase**.
- Built a **LangGraph-based scoring workflow** that decomposes job descriptions into requirements, evaluates each requirement against resume evidence, and returns **evidence-based verdicts**.
- Implemented semantic search and duplicate detection over user projects and experience data using **pgvector** and **text-embedding-3-small**, routing matches above a 0.86 similarity threshold to human review before merging.
- Designed **on-demand AI workflows** for bullet rewriting and evidence-gap scanning, keeping them off the main analysis path and caching results after first use to reduce unnecessary model calls and API cost.
- Implemented an AI customer support chatbot with **retrieval-augmented generation (RAG)**, iteratively evaluating and refining retrieval and intent routing to improve **privacy-intent routing accuracy from 88% to 98%**.

#### DaVQi AI Tutoring Platform | Demo

- Designed and deployed an AI tutoring platform with automated grading, classroom management tools for tutors, and learning progress reports for parents and tutors.
- Conducted **prompt engineering experiments** comparing five strategies across GPT-4o-mini and GPT-5.2, improving grading accuracy **from 49% to 74%**.
- Designed an **intent-routing system** to classify user inputs, and **fine-tuned BERT and RoBERTa** as cost-efficient alternatives to GPT, reducing inference cost by **95%** and latency by **10x**.
- Built a **RAG pipeline** by chunking and embedding reference documents into **ChromaDB**, retrieving relevant context with **semantic similarity**, and grounding GPT-5.2 analysis for misconception detection and actionable feedback.

### Systems Engineering Intern - Software Modeling & Test Automation

Mountain View, CA

*KBR - NASA Ames Research Center*

*Oct 2023 – Apr 2024*

- Built and refined test systems for spacecraft propulsion workflows using **MATLAB/Simulink**, translating **engineering requirements into executable simulation and test logic**.
- Cleaned, validated, and transformed **telemetry test data** into structured inputs for automated test workflows, resolving **missing and duplicate values** before ingestion.
- Adapted test scenarios and software logic as system requirements evolved, developing and validating automated workflows across four propulsion boosters and analyzing telemetry to **identify anomalous system behaviors**.
- **Debugged** test failures and timeout issues across simulation and data workflows, tracing anomalous behavior to idled systems in **SQL-based test data** that triggered unintended loops and improving **test pipeline efficiency by approximately 20%**.

## Technical Skills

---

**Languages:** Python, TypeScript, JavaScript, SQL

**AI / ML:** LangGraph, LangChain, OpenAI API, RAG, Embeddings, Semantic Search, Model Evaluation, BERT

**Frameworks and Data:** FastAPI, React, PostgreSQL, Supabase, pgvector, ChromaDB

**Cloud and Tools:** Vercel, Render, GitHub Actions, Git, Docker
